

CONTROL UNITS

INDEX

- SAFETY MATS
- SAFETY EDGES
- SAFETY BUMPERS
- CONTROL UNITS

SAFETY MATS

The pressure-sensitive mat is a “safety device” which features an electro-pressure sensible element to detect the presence of persons.

The presence of one or more persons over 35 kg closes a contact inside the sensor.

The change in state of the internal sensor (NO to NC) is processed by the control unit which emits a machine stop signal and removes the hazardous situation.

SENSITIVE EDGES

The sensitive edge is a safety component used to avoid crashing or cutting risks by sliding doors, automatic moving guards, automated moving guards, electrical gates, etc.

The edges feature a PVC coating with an internal sensor, consisting of 2 conductive blades, separated by a non-conductive part. When the edge is pressed, the blades come into contact and make the circuit.

The change in state of the internal sensor (NO to NC) is processed by the “control unit” that emits a stop signal to the machine thereby removing the hazardous situation.

SAFETY BUMPERS

The pressure-sensitive safety bumper is used to protect personnel from collision against vehicles or moving parts of an industrial machine such as AGV, stacker cranes, wire-guided vehicles, automatic warehouses, etc...

When minimum compression is applied to the bumper, after a pre-run, the internal contact of the sensor closes and changes its state (from NO to NC). The “control unit” immediately emits a stop signal indicating that a change in the sensor state has occurred and removes the hazardous situation.

After the pre-run, the bumper still allows for a compression called “overrun”, which varies according to the bumper depth, and such to further soften the impact.

CONTROL UNIT OR CONTROL DEVICE FOR SAFETY MATS, SAFETY EDGES AND SAFETY BUMBERS

The control unit is an apparatus conceived and used to constantly check proper operation of a sensor (safety mat, safety edge or safety bumper).

Pressure exerted on the sensor causes the output contact of the control device to break.

The control unit constantly verifies good operation of both the sensor and the connecting circuit.

A control device is capable of supervising and controlling several sensors but it cannot perform the self-diagnosis to detect which of the sensors is faulty.

If several sensors are installed, it is a good practice to use one control unit every 3 or 4 sensors.

Models available:
GP02/E
GP02R.T - GP02R.T1
GP04T - GP04R
GP02R and GP02R-C only for edges with electric resistance, 8.2 kΩ

DESCRIPTION

Emergency stop circuit of the sensor used to manage and control the sensor and equipped with two safety relays with forced opening contacts.

The relays, which are usually activated, deactivate if the following conditions arise:

- Power failure
- Activation of the safety mat, edge and bumper.
- Internal faults to the control unit;
- Breaking of the circuit inside the safety mat, safety edge and safety bumpers or interruption of connecting cables between the control unit and the sensor (safety mat, edge and bumper).

The devices are supplied with automatic reset function. Manual reset function also available.

In case the control unit is used without reset function, this option may be supplied through the control system of the machine (please refer to EN 13849-1 Standard).

OPERATION

Two separate channels detect voltage at the ends of sensor terminals (safety mat, edges, bumper) and each channel switches a safety relay with forced opening contacts.

MODELS:

GP02/E GP02R.T (automatic reset) - **G02R.T1** (manual reset)

Supply voltage is limited by a current limiting switch and relevant piloting circuit in order to prevent short-circuit currents to arise during the closing phase of the sensor (safety mat, edge and bumper). The control unit performs a self-control cycle each time a cycle or a putting into operation is executed. Input terminals are provided for:

- Test signal which activates/deactivates the circuit of the control device by stimulating the activation of the sensor and verifying the system efficiency;
- Manual/Feedback reset signal.

The two modules differ in the number of output contacts: model GP02/E has one NO safety contact whereas model GP02/E-S2 and GP02R have two safety NO contacts.

GP04T

Safety unit for 4-wire sensor with 2 static outputs type OSSD (PNP).

GP02R AND GP02R FOR SAFETY EDGES WITH ELECTRIC RESISTANCE 8.2 KΩ

Two symmetrical circuits detect the current circulating in the edge set for the 8.2 KΩ resistance.

When a variation resulting from a fault or an edge activation is detected, the output relays are de-energized. They break the safety contacts.

GP04R

Safety control units for 2-wire resistive sensor, 8.2 KΩ, with 2 static outputs OSSD (PNP).

TECHNICAL FEATURES
